EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Dan Nevriy on June 9, 2008.

The application has been amended as follows:

In the Claims:

Claims 11, 90, 124, 137-139, and 155 are canceled.

1. (Currently Amended) A method for detecting a target DNA or RNA polynucleotide, said method comprising:

- (a) incubating a single-stranded target polynucleotide with a second polynucleotide comprising a sequence that hybridizes to the single-stranded target polynucleotide forming a bubble complex, wherein said bubble complex comprises a first double-stranded upstream region, a non-complementary single-stranded middle region, and a second double-stranded downstream region, an initiator, an RNA polymerase, and a terminator, wherein said initiator hybridizes with said target polynucleotide;
- (b) extending said initiator until said terminator is incorporated into an oligonucleotide transcript, by the process of abortive transcription;
- (c) repeating steps (a) and (b), thereby synthesizing multiple reiterative oligonucleotide transcripts from said target polynucleotide; and

(d) detecting or quantifying said reiterative oligonucleotide transcripts, wherein the presence of said reiterative oligonucleotide transcripts is indicative of the presence of said target DNA or RNA polynucleotide.

85. (Currently Amended) The method of claim 1, wherein said single-stranded target polynucleotide is DNA.

97. (Currently Amended) The method of claim 96, wherein immobilizing comprises hybridizing a capture probe to a portion of said single-stranded target polynucleotide sequence.

101. (Currently Amended) A method for detecting multiple abortive reiterated oligonucleotides from a target DNA or RNA polynucleotide, said method comprising:

- (a) incubating a single-stranded target polynucleotide with a second polynucleotide comprising a sequence that hybridizes to the single-stranded target polynucleotide forming a bubble complex, wherein said bubble complex comprises a first double-stranded upstream region, a non-complementary single-stranded middle region, and a second double-stranded downstream region, an initiator, an RNA polymerase, wherein said initiator hybridizes with said target polynucleotide;
- (b) synthesizing multiple oligonucleotides from said single-stranded target polynucleotide, wherein said initiator is extended until terminated due to nucleotide deprivation, thereby synthesizing multiple abortive reiterative oligonucleotide transcripts; and

- (c) detecting or quantifying said abortive reiterative oligonucleotide transcripts.

115. (Currently Amended) The method of claim 1, wherein said single-stranded target polynucleotide is RNA.

140. (Currently Amended) The method of any one of claims 1 and 115, wherein said single-stranded target polynucleotide is RNA.

144. (Currently Amended) The method of claim 140, further comprising (a) incubating said single-stranded target RNA with a reverse transcriptase.

145. (Currently Amended) The method of any one of claims 1 and 115, comprising incubating said single-stranded target polynucleotide with additional ribonucleotides.

148. (Currently Amended) The method of any claims 1 and 115, wherein said single-stranded target polynucleotide is from a virus.

149. (Currently Amended) The method of claim 148, wherein said single-stranded polynucleotide is RNA.

150. (Currently Amended) The method of any one of claims 1 and 115, wherein said single-stranded target polynucleotide is from a bacterium.

156. (Currently Amended) A method for detecting a target DNA or RNA polynucleotide, said method comprising:

- (a) incubating a single-stranded target polynucleotide with a second polynucleotide with a sequence that hybridizes to the single-stranded target polynucleotide forming a bubble complex, wherein said bubble complex comprises a first double-stranded upstream region, a non-complementary single-stranded middle region, and a second double-stranded downstream region, an RNA polymerase, an initiator wherein said initiator is a tetranucleotide, pentanucleotide, hexanucleotide or analog thereof, and a terminator, wherein said initiator hybridizes with said target polynucleotide;
- (b) extending said initiator until said terminator is incorporated into an oligonucleotide transcript, by the process of abortive transcription;
- (c) repeating steps (a) and (b), thereby synthesizing multiple reiterative oligonucleotide transcripts from said target polynucleotide; and
- (d) detecting or quantifying said reiterative oligonucleotide transcripts, wherein the presence of said reiterative oligonucleotide transcripts is indicative of the presence of said target DNA or RNA polynucleotide.

Examiner's Reasons for Allowance

The following is an examiner's statement of reasons for allowance:

The prior art neither teaches nor suggests for a method for detecting a single-stranded target polynucleotide by forming an artificial bubble complex between the single-stranded target polynucleotide and a second polynucleotide, wherein said artificial bubble complex comprises a first

double-stranded upstream region, a non-complementary single-stranded middle region, and a second double-stranded down stream region, allowing for the RNA polymerase to catalyze a transcription reaction to start therefrom.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
